Consider solving min f(x) with L-Lips
Chitz gradient via XK+ XK- XK PP(XK)

with 76 EIR!

Theorem Suppose & is diff with L-Lips grad Then for T20 1 5 10 f(xx) 1 2 = 2L (f(x0) - minf)

when $\alpha_k = 1/2$ or with exact linesearch.

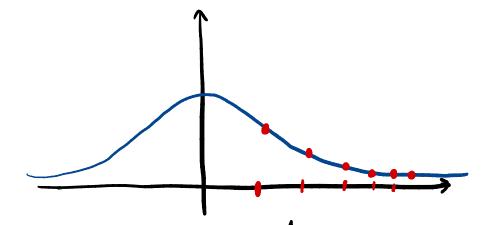

$$\frac{1}{T} \sum_{k=0}^{T-1} \|\nabla f(x_k)\|_2^2 \leq \max \left\{ \frac{1}{\eta \alpha}, \frac{L}{2 \pi \eta (1-\eta)} \right\} \frac{(f(x_0) - \min)}{T}$$

when we use Armijo backtracking. +

Consequence
$$T = \Omega(\frac{1}{\epsilon})$$
 then

Warnings

• χ_{κ} might not converge! Consider $\rho(x) = \exp(-x^2)$

• Even if $x_k \rightarrow x^2$, the limit might not be a local min.

Exercise: Think of an example where this happens.

proof: We prove it for $x = \frac{1}{L}$, the rest of the proofs are similar. By DL, we have YKZO fex kti) 4 flx ic) - 1 10 P(XX) 112 Summing all of these up to T-1 f(T) < f(x0) - 1 5 10 f(xx) ||2 k=0 $\Rightarrow \sum_{k=0}^{\tau-1} \|\nabla f(x_k)\|^2 \leq 2L [f(x_0) - f(x_{\tau})]$ < 2L [f(xo) - min f]. Dividing both sides by T gives the result.

The reason why we have such slow converges is that our function can grow very slowly

is small, you don't move that much. Theorem. Assume f is twice diff and x* is a second-order critical point $\nabla f(x^*) = 0$ and $\nabla^2 f(x^*) \ge \lambda I$ There exists E>0 s.t if $x_k \in B_e(x^*) t_k$ $f(x_{T}) - f(x^{*}) \leq (1 - \frac{\lambda^{2}}{2L^{2}}) (f(x_{k}) - f(x^{*}))$ ntuition For points where 2nd-order approximation grows, we have Fhat if we start close $T = \Omega \left(\left(\frac{\lambda^2}{L^2} \right)^2 \log \left(\frac{f(x_0) - f(x_0)}{\epsilon} \right)$

suffice for $f(x_{+}) - f(x_{o}) \leq \varepsilon$. Proof: Since $\lambda_{min}(\nabla^2 f(x))$ is conti mous = 3 2 200 s.t. \tag{x \in B_{\mathbb{E}}(x^*)} $\lambda_{\min}(\nabla^2 f(x)) \geq \frac{\lambda}{2}$. Then, for any 11311 se we can define $\Psi(t) = f(x^* + t\bar{s})$ and 4'(1) = 4'(0) + 5 4"(t) dt $\Rightarrow \nabla f(x^4 + \bar{s})^T s = 0 + \int_{s}^{s} s^T \nabla^2 f(x^4 + \bar{s}) s dt$ > > 19 112 2 \frac{\lambda}{2} 11511^2. => \frac{\lambda \| \su \| \lambda \| \su \| \lambda \| 11 7 f (x + s)1. (ご) By Taylor Approximation:

L
$$||s||^2 \ge f(x^*+s) - (f(x^*) + o^*s)$$
 $= f(x^*+s) - f(x^*)$ (0)

Combining (i) and (b)

4.11 $\nabla f(x+s)$ 11² $\ge 2 (f(x^*+s) - f(x^*))$

Then, using DL
 $f(x_{k+1}) - f(x^*) \le f(x_k) - f(x^*)$
 $= 2 ||\nabla f(x_k)||^2$

Follows

From (t) $\le (1 - \lambda^*) (f(x) - f(x^*))$

Better generaters for convex functions

Lemma (Characterization L-smoothness for convex functions)

Suppose that $f: \mathbb{R}^d \to \mathbb{R}$ is diff and convex.

Then the following are equivalent 1) f has L-Lipschitz gradient 2) = $\|\cdot\|_2^2 - f(\cdot)$ is convex. 3) f(y) < f(x) + \partial f(x), y-x) + \frac{1}{2} ||x-y||^2 4) (of (y) - of (x), y-x> = 1 11 of (y)- of (x) If further f is twice diff the following are also equivalent to the above 5) $\nabla^2 f(x) \leq LI \quad \forall x \quad (LI - \nabla^2 f(x) \geq 0)$ f(x) +くかf(x), y-x) + 上 1x-y1に Intuition f(x) + < \ P(x), y - x)

Proof: (2)
$$\Leftrightarrow$$
 (5) $h(x) = \frac{1}{2} ||x||^2 - f(x)$

is convex

 $\Rightarrow \nabla^2 h(x) \ge 0$
 $\Leftrightarrow LI \ge \nabla^2 f(x)$

Second order characteritation

(2) \Leftrightarrow (3) $h(x) = \frac{1}{2} ||x||^2 - f(x)$ is convex

 $\Leftrightarrow h(x) + \langle \nabla h(x), y - x \rangle \le h(y) \quad \forall y, x$
 $\Leftrightarrow h(x) + \langle \nabla h(x), y - x \rangle \le h(y) \quad \forall y, x$
 $\Leftrightarrow h(x) + \langle \nabla h(x), y - x \rangle \le h(y) \quad \forall y, x$
 $\Leftrightarrow h(x) + \langle \nabla h(x), y - x \rangle - \langle \nabla h(x), y - x \rangle$
 $\Leftrightarrow f(y) \le f(x) + \langle \nabla h(x), y - x \rangle + \frac{1}{2} ||x - y||^2$

(4) \Rightarrow (1) By Cauchy - Schwarz

 $\Leftrightarrow f(y) \le f(y) = \begin{cases} (x) + \langle \nabla h(x), y - x \rangle + \frac{1}{2} ||x - y||^2 \end{cases}$
 $\Leftrightarrow f(y) \le f(y) = \begin{cases} (x) + \langle \nabla h(x), y - x \rangle + \frac{1}{2} ||x - y||^2 \end{cases}$
 $\Leftrightarrow f(y) \le f(y) = \begin{cases} (x) + \langle \nabla h(x), y - x \rangle + \frac{1}{2} ||x - y||^2 \end{cases}$
 $\Leftrightarrow f(y) = \begin{cases} (x) + \langle \nabla h(x), y - x \rangle + \frac{1}{2} ||x - y||^2 \end{cases}$
 $\Leftrightarrow f(y) \le f(y) = \begin{cases} (x) + \langle \nabla h(x), y - x \rangle + \frac{1}{2} ||x - y||^2 \end{cases}$
 $\Leftrightarrow f(y) = \begin{cases} (x) + \langle \nabla h(x), y - x \rangle + \frac{1}{2} ||x - y||^2 \end{cases}$
 $\Leftrightarrow f(y) = \begin{cases} (x) + \langle \nabla h(x), y - x \rangle + \frac{1}{2} ||x - y||^2 \end{cases}$
 $\Leftrightarrow f(y) = \begin{cases} (x) + \langle \nabla h(x), y - x \rangle + \frac{1}{2} ||x - y||^2 \end{cases}$
 $\Leftrightarrow f(y) = \begin{cases} (x) + \langle \nabla h(x), y - x \rangle + \frac{1}{2} ||x - y||^2 \end{cases}$
